

Decision Memo

Sample output · 21 June 2026 · **EXAMPLE**

THE DECISION

Build an in-house AI support agent this quarter, on our current vendor's model.

Why now: Ticket volume is up roughly 40% and headcount is frozen.

WHAT IT ASSUMES

- Our current vendor's model stays available and priced roughly as today.
- Agentic tooling is mature enough to trust in production this quarter.
- Support volume keeps growing, so the build pays back.

STRESS-TEST ACROSS PLAUSIBLE FUTURES

Move	Capability leap	Supply shock	Agents arrive	Slow lane	Verdict
Build the support agent now, on the current vendor's model	Holds	Breaks	Holds	Holds	Fragile (Breaks 1/4)
Standardise an internal knowledge base the agent retrieves from	Holds	Holds	Holds	Holds	Robust (Holds 4/4)

WHAT TO DO MONDAY

- **Standardise the knowledge base:** robust across all four futures. Do it now; it pays off whatever happens.
- **Build the support agent:** fragile. It breaks under a supply shock. The hedge: build model-agnostic and start thin, so the model is swappable. Watch one signal: the day that vendor changes its pricing or access terms.

You stay in charge of the call. The stress-test does not make the decision; it stops the future from making it for you.
